ABSTRACT

This report contains data and descriptive analyses of social and economic characteristics of students from nursey schools through higher education. The figures are based on the Current Population Survey conducted in October 1974 by the Bureau of Census. Recent changes in college enrollments are analyzed in the text part of the report. Changes in school enrollment patterns for students attending nursery school through college by socioeconomic characteristics such as age, race, sex, Spanish origin, marital status, dependent family members, metropolitan residence, and level of income are presented in 24 statistical tables. Descriptive analysis in the text is based on the following tables of statistical data: (1) school enrollment rates for persons 3 to 34 years old, by age and sex: October 1974 and October 1950; (2) characteristics of college students 25 to 34 years old: October 1974; (3) characteristics of students 35 years old and over: October 1974; (4) college enrollment of the population 16 to 34 years old, by year of school, sex, and race: October 1974; (5) college enrollment of the 1971 freshman class: October 1971 to October 1974; (6) college enrollment of persons 16 to 34 years old, by race and age: October 1974 and October 1970; and (7) college enrollment rates for dependent family members 18 to 24 years old, by family income: October 1974 and October 1970. SCHOOL ENROLLMENT—SOCIAL AND ECONOMIC CHARACTERISTICS OF STUDENTS: OCTOBER 1974

This report presents an analysis of data from the Current Population Survey on school enrollment for October 1974. Recent changes in college enrollment are discussed in the text. Changes in school enrollment patterns for students attending nursery school through college by socioeconomic characteristics such as age, race, sex, and income level are presented in statistical tables. Persons in the Armed Forces living in barracks or inmates of institutions are not included in the population estimates shown in the statistical tables.

INTRODUCTION

In October 1974, at least one in every four persons in the United States was enrolled in school. Including students in nursery school through college, 61.4 million persons 3 years old and over were attending school. This does not include students in technical or vocational school or adult education classes. A quarter century ago, in 1950, only about one-fifth of the population was enrolled in school (table A). The changes in enrollment since then have been greatest among the youngest and oldest students, whose school attendance is voluntary. The enrollment rate (that is, the percent of an age group enrolled in school) has changed little among students of compulsory school attendance age; about 98 percent of all children 6 to 15 years old were enrolled in regular school in 1950 and 99 percent in 1974. About 392,000 children 6 to 15 years old were still not in school for various reasons in 1974. Among children under 6 years old, the enrollment rate has increased by about two-thirds in the last decade to about 50 percent; and the enrollment rate for persons 16 to 29 years old has increased by about four-fifths since 1950.[1] The increases in enrollment rates for persons 16 to 29 years old have been especially large for women.

Enrollment of older college students. The most dramatic increase in college enrollment in the 1970's have been among older students.[2] Although half of the college students were still 18 to 21 years old, students 25 years old and over comprised one-third of all college students in 1974. Of the 9.9 million persons in college in 1974, 1 million were 35 years old and over. The older students (25 years and over) made up about two-thirds of all part-time students and one-sixth of the full-time students. In addition to persons in college, there were about 154,000 persons 25 years old and over enrolled in school below the college level.

Among students under 35 years old, about 60 percent of the increase in college enrollment in the 1970's has been among those 25 to 34 years old. Increases in enrollment by these students has been especially dramatic since 1970, following the large increases among younger students in the mid-1960's when the children who were born during the period of the post-

[1] These figures are significantly different at the 90 percent level of confidence.

[2] From 1972 to 1974 the number of college students 25 years old and over has increased by about one-fourth. No survey information on students 35 years and over is available for years prior to 1972.

Table A. School Enrollment Rates for Persons 3 to 34 Years Old, by Age and Sex: October 1974 and October 1950

Age	Percent enrolled, 1974			Percent enrolled, 1950		
	Total	Male	Female	Total	Male	Female
3 and 4 years	28.8	28.1	29.5	(NA)	(NA)	(NA)

NA Not available.

World War II baby boom reached college age and crowded the colleges, as they had crowded elementary and secondary schools the decade before. In 1974, persons 25 to 34 years old comprised one-fourth of all college students under 35 years old; in the mid-1960's the corresponding proportion was less than one-fifth, when the enrollment of persons 25 to 34 years old barely kept up with the increases in enrollment of the younger students.

The last time older students were such a large part of the college population was in the mid-1950's when large numbers of veterans were returning to school on the GI Bill. At that time one-third of the older male students were veterans; in the late 1940's and early 1950's 9 out of 10 were veterans, and in 1974 about 55 percent were veterans. Two factors contributed to the older college population in the mid-1950's: (1) there were proportionately more persons 25 to 34 years old in the college age population than in the 1960's and 1970's; and (2) veterans' benefits enabled older men who served in the Korean conflict to enroll in college.

Since 1970, the proportion of persons 18 to 24 years old enrolled in college has remained the same (about 25 percent); the proportion of persons 25 to 34 years old enrolled has increased from about 2 percent in the early 1950's, to 5.5 percent in 1970, and 7.5 percent in 1974. Graduate school accounts for a large proportion—but not all—of the students 25 to 34 years old (see table B). About 42 percent of these older students were graduate students and 33 percent were just beginning college as freshmen and sophomores. Women comprised 38 percent of college students 25 to 34 years old in 1974, less than their proportion of all college students under 35 years old. Black students comprised about one-tenth of all college students 25 to 34 years old, half were freshmen and sophomores, and only one-fourth were graduate students, quite different from the distribution of all older students.

The 1 million students 35 years old and over enrolled in college in 1974 comprised one-tenth of all college students (table C). About half of these students were women; about four-fifths attended college part time and were in the labor force.

Two-year and four-year college. More persons (14 to 34 years old) were attending undergraduate school in the United States in 1974 than ever before. The most recent gains in college enrollment appear to be created by new students entering rather than students remaining in college longer, as indicated by the substantial increase at the freshman and sophomore levels in the last year. Between 1973 and 1974, junior and senior enrollment did not change significantly, whereas freshman and sophomore enrollment increased 11 percent and accounted for about four-fifths of the total increase.

The college enrollment gains were also due to increases in enrollment in junior and community colleges, which have increased their share of the total undergraduate population. These schools enrolled 21

Table B. Characteristics of College Students 25 to 34 Years Old: October 1974

(Numbers in thousands)

Characteristic	Number			Percent		
	Total	Male	Female	Total	Male	Female
Total, 25 to 34 years old	29,215	14,133	15,082	(X)	(X)	(X)
Enrolled in college	2,202	1,371	831	100.0	100.0	100.0

X Not applicable.

percent of the undergraduates in 1966 (the first year for which data were available) and 28 percent in 1974. About one-fourth of all junior college enrollees were students over 21 years old attending part time. Since 1970, junior college enrollment has increased by nearly one-fourth, largely among students over 21. In 1970, 31 percent of the junior college students were over 21; in 1974, 12 percent were over 21. In both years about 14 percent of the students in the first 2 years of 4-year colleges were over 21 years old.

Two-year and four-year college populations differ in several ways. More students in junior colleges than 4-year colleges are older, married, attending part time, from less affluent homes, and with parents who have less education than students in four-year colleges or universities. Part-time attendance is most common in 2-year schools. Forty percent of the students in 2-year colleges and 15 percent in 4-year colleges were attending part time. Among junior college students, 30 percent were married and living with their spouses, twice the proportion who were married among those in 4-year colleges.

Among the dependent family members 18 to 24 years old enrolled in college in 1974, those in junior college had lower family incomes than those in 4-year colleges. Thirty-one percent of these dependent family members in junior colleges had family incomes of less than $10,000 in the previous 12 months; whereas 19 percent of those in the first 2 years of 4-year colleges had less than $10,000.[3] Most "dependent" college students are members of their parents' households, even though they may be living in college housing or private housing at the college. A dependent family member is a relative of the household head, other than a wife, who is not married with spouse present. Fully 72 percent of junior college students 18 to 24 years old, and an even larger proportion, 85 percent, of students in the first 2 years of 4-year colleges are dependent family members.[4] Among dependent family members in 2-year colleges,

[3] Dependent family members are students of "other marital status" in table 24.

[4] These figures are based on the number of persons reporting type of college.

Table C. Characteristics of Students 35 Years Old and Over: October 1974

(Numbers in thousands)

only 16 percent were from families in which the head completed college and 29 percent were from families in which the head had not completed high school. Of families of students in the first 2 years of 4-year schools, 34 percent of the heads had completed college and only about 19 percent had not completed high school.

Enrollment of black and white students. College enrollment of black students has increased in the last decade as they have become a larger proportion of all college students 16 to 34 years old (table D). Black college students were 9 percent of all students in 1974; they made up only about 5 percent of all students in 1964. The number of black students in college increased by 19 percent from 1973 to 1974 and by 56 percent since 1970. The corresponding white enrollment rose 15 percent since 1970.

Although in the past 10 years, black enrollment has approached the level of white enrollment, racial differences remain between college classes. There is a substantially smaller proportion of black students in the senior year than in the freshman year. In the freshman year, blacks made up about 12 percent of all students in 1974, about the same as their proportion in the population; in the senior year, they were 7 percent of all students. At the beginning of the decade, they were 9 percent of all freshmen and 5 percent of the seniors (not significantly different from seniors in 1974). Although blacks entered college as freshmen at a rate proportional to their share of the population in 1974, black seniors who were ready for graduation constituted a lower proportion than their share of the total population. The number of black seniors enrolled in college may be low both because a lower proportion entered as freshmen 3 years earlier and because many discontinued enrollment.

College discontinuation rates have been substantial for all groups—black, white, male, and female. Among all students 16 to 34 years old, there were about twice as many freshmen as seniors in 1974; among blacks three times as many students were freshmen as seniors, about the same as at the beginning of the decade. Although some of the difference between the number of freshmen and seniors in each year may be caused by increases in freshman enrollment over time, a substantial part of the difference in 1974 was due to discontinuing enrollment in the first few years of college. For all students there were about 56 percent as many seniors in 1974 as freshmen 3 years earlier. In the same period the number of white college freshmen did not change significantly, while black freshmen increased by about one-third.[5]

[5] See **Current Population Reports**, Series P-20, No. 241, "Social and Economic Characteristics of Students: October 1971."

Table D. College Enrollment of the Population 16 to 34 Years Old, by Year of School, Sex, and Race: October 1974

(Numbers in thousands)

Graduate	100.0	55.2	36.3	3.4	2.6	2.5

Men who enroll in college as freshmen are more likely to remain through 4 years of college than women. Men made up 55 percent of freshmen in 1971 and 60 percent of seniors in 1974. Although college participation of other groups has been increasing, white men still made up about half of all college students in 1974 (49 percent, a decrease of 5 percentage points since 1971). White men constituted 44 percent of freshmen and 54 percent of seniors in 1974. They were 49 percent of the freshman class in 1971, when most of the 1974 seniors should have entered college.[6] White women, on the other hand, constituted 40 percent of the freshman class in 1971 and remained about the same proportion as seniors in 1974. Black students made up 9.5 percent of freshmen in 1971 and decreased to 7.0 percent of seniors 3 years later (significant at the 90 percent level of confidence). Not only do significant numbers of each group fail to continue their educations, but white men are less likely to leave college before graduation than the others.

Table E and figure 2 show an approximation to college enrollment of the 1971 freshman class by sex and race, based on the number of students in the first year of college in 1971 and the proportion remaining in school through the fourth year in 1974; these data provide an estimate of the proportion of freshmen who complete college and demonstrate the differences in discontinuation rates for some of the population groups. These figures are not based on a longitudinal survey but represent an annual survey of each college class. Thus they may not represent actual experiences of a single college class. For all students, there were only a little over half as many seniors in college in 1974 as there were freshmen in 1971. For white men, there were about 61 percent as many seniors and for black females about 35 percent as many seniors as freshmen 3 years earlier. Although not all students who complete college finish in 4 years, at least half do; for example, about 10 percent of sophomores and juniors and 4 percent of seniors in 1974 had been out of school in 1973 and returned in 1974.

Black and white college students were equally likely to be attending full time in 1974. About three-fourths of the 16 to 34 year old college students in each group were attending full time. About 57 percent of both black and white students were under 22 years old and one-fourth were 25 to 34 years old. About one-fourth of the black and white students were married and living with their spouses and about 45 percent of both black and white students were women.

[6] 1971 freshmen and 1974 seniors were significantly different at the 94 percent level of confidence.

Table E. College Enrollment of the 1971 Freshman Class: October 1971 to October 1974

(Numbers in thousands)

Race and sex	Number enrolled (students 16 to 34 years old)				Percent of first year students in 1971			
	Freshman (1971)	Sophomore (1972)	Junior (1973)	Senior (1974)	Freshman (1971)	Sophomore (1972)	Junior (1973)	Senior (1974)

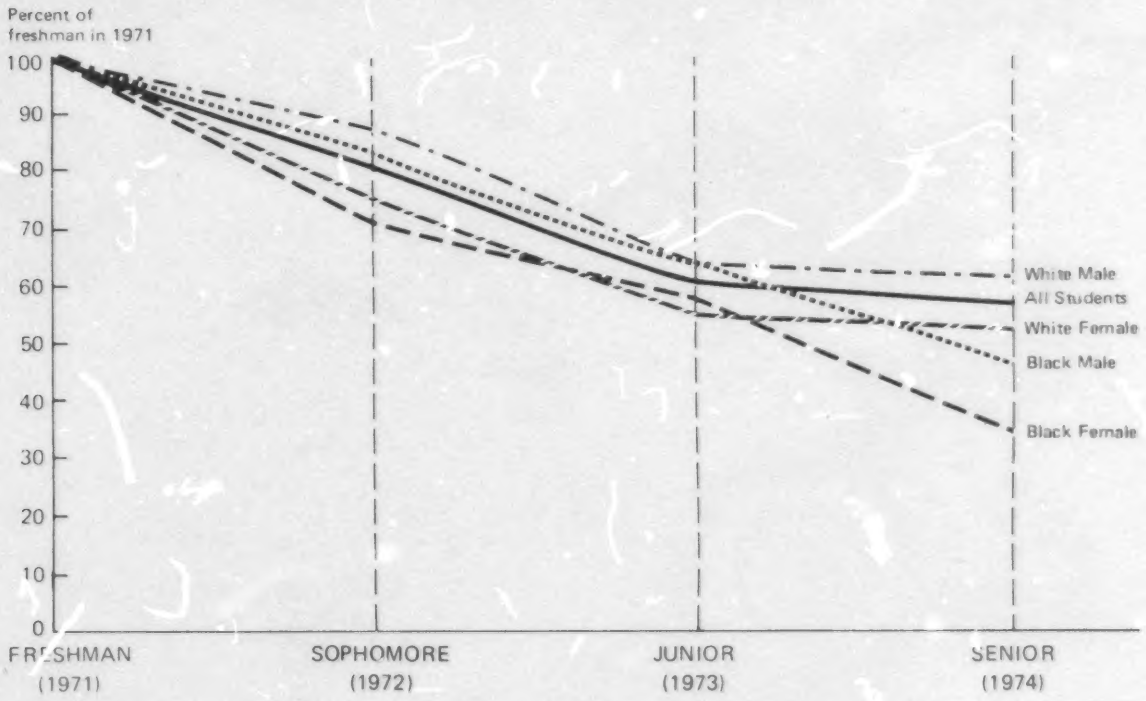
Female.....	118	83	69	41	100.0	70.3	58.5	34.7

Note: This is an approximation of retention rates based on annual data on total number of persons in each college class.

Figure 2. College Enrollment of the 1971 Freshman Class: October 1971 to October 1974



Source: Table E

Both blacks and whites have experienced large increases in college enrollment among older students in the 1970's (table F). The increase in total enrollment among white students since 1970 has been only 15 percent, but for blacks it has been 56 percent. For both groups about half of the increase was among students 25 years old and over. Among 18- and 19-year-olds the proportion of whites enrolled in college decreased from 1970 to 1974. Although it appears that for blacks college enrollment rates have increased for each age group and the difference between the rates for whites and blacks at each age is narrowing, the trend is not statistically significant.

In 1970, the discrepancies between enrollment rates of blacks and whites based on income were appreciable. Among dependent persons 18 to 24 years old in families making less than $10,000, about twice as large a proportion of whites as blacks were enrolled in college. Among those in families with income of $10,000 and over, the corresponding difference was smaller (significantly different from families making less than $10,000 at the 90 percent level of confidence).

However, in 1974, black and white students in the highest and lowest income ranges were attending in more equal proportions. Although a smaller proportion of white families than black families were in lower income levels, the college attendance of dependent family members 18 to 24 years old was about the same for the two groups in 1974.[7] For persons in families with less than $10,000 income in the previous 12 months, about the same proportion of blacks and whites attended college. This is also true for those families making $20,000 or more. For both races, about 20 percent of the lowest income group and 54 percent of the highest income group were in college. For persons in middle income families, making $10,000 to $19,999 total money income, white persons were still more likely to be enrolled in college. For both groups the probability of college enrollment tended to increase with income.

The lower income distribution of black families was reflected in the fact that 64 percent of the 18 to 24 year-old black students who were dependent family members in 1974 were from families with incomes of less than $10,000, whereas 16 percent of white students were from families of the same economic status. One-fourth of the black students and 43 percent of the white students were from middle income families making $10,000 to $19,999.

[7] Dependent family members are students of "other marital status" in table 13.

EXPLANATION OF POPULATION ESTIMATES

In order to obtain estimates of the characteristics of the civilian noninstitutional population at the time the Current Population Survey is taken, weighted sample results of the survey are inflated using the most recent postcensal population estimates as bases. The base for inflation factors used with the October 1972 to 1974 surveys was the 1970 Census of Population; all previous years (since 1961) have been based on the 1960 Census of Population. A comparison of October 1971 survey data based on the 1960 census with revised data using the 1970 census as a base, shows the 1970-based estimates for all ages under 12 years old to be smaller than the 1960-based estimates. In comparing data based on different census years, it is important to consider the effect of weighting procedures. **Current Population Reports**, Series P-20, No. 260, appendix table B shows school enrollment data by age, sex, and level for October 1971 based on the 1970 census figures.

RELATED REPORTS

Advance data on school enrollment for October 1974 were presented in Series P-20, No. 278. Statistics on school enrollment for October of the years prior to 1974 have been published in other reports in Series P-20. See backcover for list.

Data on college plans of high school seniors for October 1974 were presented in "College Plans of High School Seniors: October 1974," **Current Population Reports**, Series P-20, No. 284. Data on nursery school and kindergarten enrollment for October 1974 were published in DHEW Publication No. (NCES) 76-147, "Preprimary Enrollment: October 1974" by the National Center for Education Statistics. A report on the relationship between preprimary enrollment of children and labor force participation of mothers from the years 1967 to 1974 is being prepared by the Bureau of the Census.

Statistics on school enrollment for cities, standard metropolitan statistical areas, States, regions, and the United States appear in reports of the decennial censuses. Detailed statistics on school enrollment by age and socioeconomic characteristics for regions and the United States are presented in Subject Reports of the 1970 census, especially in PC(2)-5A, **School Enrollment.**

Figures on school enrollment from the October Current Population Survey differ from decennial census data for reasons in addition to the difference in the dates. In the first place, the survey data exclude the institutional population and members of the Armed Forces. These two groups were included in the census. Second, there were differences in field work. The small group of Current Population Survey enumerators were more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Third, the census was taken in April and relates to enrollment since February 1, whereas the surveys were taken in October and relate to enrollment in the current term. This difference in months of the year affects not only the extent of school enrollment (through "dropouts" during the school year, etc.) but also the level of school in which persons of a given age are enrolled.

Data from school systems. Information on college enrollment is also collected and published by Federal, State, and local governmental agencies, and by independent research organizations. This information is generally obtained from reports of school systems and institutions of higher learning, and from other surveys and censuses. These data are only roughly comparable with data collected by the Bureau of the Census by household interviews, however, because of differences in definitions, subject matter covered, and enumeration methods. The census data are subject to sampling variability, which may be relatively large where numbers for specific age or population groups, or for given school categories, are small.

APPENDIX B

DEFINITIONS AND EXPLANATIONS

Population coverage. The figures shown are for the civilian population excluding the relatively small number of inmates of institutions.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.

2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

   a. The additional city or cities have at least 250,000 inhabitants.
   b. The additonal city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

School enrollment. The school enrollment statistics from the current surveys are based on replies to the enumerator's inquiry as to whether the person was enrolled in school. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of graded public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time or part-time basis and during the day or night. Thus, regular schooling is that which may advance a person toward an elementary or high school diploma, or a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are included in the enrollment figures for "regular" schools, and are also shown separately.

"Special" schools are those which are not in the regular school system, such as trade schools or business colleges. Persons attending "special" schools are not included in the enrollment figures.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a "regular" school.

College enrollment. The college enrollment statistics are based on replies to the enumerator's inquiry as to whether the person was attending or enrolled in college. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year, except those who have left for the remainder of the term. Thus, regular college enrollment includes those persons attending a 4-year or 2-year college, university or professional school (such as medical or law school), in courses that may advance the student toward a recognized college or university degree (e.g. BA or MA). Attendance may be either full-time or part-time, during the day or night.

Two-year and four-year college. Students enrolled in the first 3 years of college were asked to report whether the college in which they were enrolled was a 2-year college (junior or community college). Those who

replied "yes" were classified as enrolled in a 2 year college. Those who replied "no" were classified as enrolled in a 4-year college.

School enrollment in year preceding current survey. An inquiry on enrollment in regular school or college in October of the preceding year was asked in the 1974 survey concerning persons 14 to 24 years old who were not currently attending regular school or who were enrolled in college.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of five levels: Nursery, kindergarten, elementary school (first to eighth grades), high school (ninth to twelfth grades), and college or professional school. The last group includes graduate students in colleges or universities. Persons enrolled in junior high school through the eighth grade are classified as in elementary school and the others as in high school.

Nursery school. A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend both in the morning and afternoon.

"Head Start." Children enrolled in "Head Start" programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under "Nursery" or "Kindergarten" as appropriate.

Public or private school. In this report, a public school is defined as any educational institution operated by publicly elected or appointed school officials and supported by public funds. Private schools include educational institutions established and operated by religious bodies, as well as those which are under other private control. In cases where enrollment was in a school or college which was both publicly and privately controlled or supported, enrollment was counted according to whether it was primarily public or private.

Full-time and part-time attendance. College students were classified, in this report, according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he was taking 12 or more hours of classes during the average school week, and part time if he was taking less than 12 hours of classes during the average school week.

Age. The age classification is based on the age of the person as of October 1, 1974.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Spanish origin. Information on origin or descent was obtained by asking "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself or his parents. The category Spanish origin includes persons of Mexican, Puerto Rican, Central or South American, and other Spanish origin.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse.

Family. The term "family," as used here, refers to a group of two persons or more related by blood, marriage, or adoption and residing together; all such persons are considered as members of one family.

Head of family. One person in each family residing together was designated as the head. The head of a family is usually the persons regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey.

Dependent family members. For the purpose of this report, a dependent family member is a relative of the household head, excluding the head's wife or any other relative who is married with a spouse present. Such persons are generally sons and daughters of the household head. However, members who are living away from home while attending college are also counted as dependent family members, if they are not married with a spouse present.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and

high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Family income. Income as defined in this report represents the combined total money income of the family before deductions for personal taxes, Social Security, bonds, etc. It is the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings received by all family members during the 12 months prior to the surveys. It should be noted that although the family income statistics refer to receipts during the previous 12 months, the characteristics of the person, such as age, marital status, etc., and the composition of families refer to the date of the survey.

The income tables include in the lowest income group (under $5,000) those who were classified as having no income in the previous 12 months and those reporting a loss in net income from farm and nonfarm self-employment or in rental income.

The income tables in this report include a separate category for families for who no income information was obtained. In most of the other Current Population Survey Reports showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the October control card are based on the respondent's estimate of total family money income for the preceding 12 months coded in broad, fixed income intervals. Income data collected in the March supplement to the Current Population Survey are based on responses to 8 direct questions asked of all persons 14 years old and over identifying 14 different sources of income and cover the preceding calendar year. (See Table B-1)

Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

Table B-1. **October CPS Control Card Family Income and March CPS Supplement Family Income for 1967 Through 1974**

Year	Median family income, October control card	Percent change	Median family income, March supplement	Percent change	October-March ratio
1967	$6,811	(X)	$7,974	(X)	0.85
1968	7,189	5.5	8,632	8.3	0.83
1969	7,770	8.1	9,433	9.3	0.82
1970	8,268	6.4	9,867	1.6	0.84
1971	8,680	5.0	10,285	4.2	0.84
1972	9,275	6.9	11,116	8.1	0.83
1973	10,274	10.8	12,051	8.4	0.85
1974	11,024	7.3	12,836	6.5	0.86

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The data for this report for the years 1947 to 1974 are based on results obtained in the Current Population Survey (CPS) of the Bureau of the Census.

Since 1973 the sample has been spread over 461 areas comprising 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 47,000 occupied housing units are eligible for interview each month. Of this number 2,000 occupied units, on the average, are visited but interviews are not obtained because the occupants are not at home after repeated calls or are unavailable for some other reason. In addition to the 47,000 there are also about 8,000 sample units in an average month which are visited but were found to be vacant or otherwise not to be interviewed.

CPS has undergone many changes in its sample size and sample design since being placed on a probability sampling basis in 1943. The table below summarizes these changes.

Year of full initiation	Sample size[1]	Number of sample areas
1973.....	47,000	461
1971.....	47,000	449
1967.....	50,000	449
1963.....	35,000	357
1956.....	35,000	330 (333)[2]
1954.....	22,000	[illegible]0
1943.....	22,000	68

[1]Eligible occupied housing units.

[2]Three sample areas were added in 1959 and 1960 to represent Alaska and Hawaii after statehood.

The estimating procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from the 1970 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For the data collected in the Current Population Surveys in the years 1962 to 1971, the independent estimates used were based on statistics from the 1960 Census of Population. For data collected in the years 1952 to 1961, the independent estimates were based on the 1950 census; and for 1947 to 1951 data, the independent estimates were based on the 1940 census.

Reliability of the estimates. Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are 90 out of 100 that this difference would be less than 1.6 times the standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables B-2, B-3, B-4, B-5, B-6, and B-7 are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific items. Tables B-2 and B-3 contain the standard errors of estimated numbers for a given class of persons 3 to 34 years old enrolled in school. Table B-6 contains the standard errors of estimated numbers of families.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. Tables B-4 and B-5 contain the standard errors of estimated percentages for a given class of persons 3 to 34 years old enrolled in school. Table B-7 contains the standard errors of estimated percentages of families. Table B-8 contains population estimates for

age, sex, and race groups in October 1974 which may be necessary for determining the total persons in an age group in order to use tables B-2 to B-5.

Note when using small estimates. Percentage distributions are shown in this report only when the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Illustration of the use of tables of standard errors. Table B of this report shows that 1,372,000 of the 14,133,000 men 25 to 34 years old were enrolled in college. Table B-2 shows that the standard error on an estimate of this size is about 50,000. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 50,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 100,000.

Of these 1,372,000 college males, 41.0 percent were attending full-time. Table B-4 shows that the standard error of 41.0 percent on a base of 1,372,000 to be approximately 2.0 percent. Consequently, chances are 68 out of 100 that the estimated 41.0 percent would be within 2.0 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 4.0 percentage points of a census figure, i.e., this 95 percent confidence interval would be from 37.0 to 45.0 percent.

Table B-2. Standard Errors of Estimated Numbers of Persons Enrolled in School

Total or White Population

(All numbers in thousands. 68 chances out of 100)

Estimated number of persons	Total persons in age group									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000

2,500.....	48		

Note: To estimate the standard errors for the period 1956-1966, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

Table B-7. Standard Errors of Estimates of Percentages of Families: 1967 to 1974

(68 chances out of 100)

Estimated percentage	Base of estimated percentage (thousands)								
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000
2 or 98.....	1.4	0.9	0.6	0.4	0.3	0.2	0.1	0.1	0.1
5 or 95.....	2.1	1.4	1.0	0.7	0.4	0.3	0.2	0.1	0.1
10 or 90.....	3.0	1.9	1.4	1.0	0.6	0.4	0.3	0.2	0.1
25 or 75.....	4.3	2.7	1.9	1.4	0.9	0.6	0.4	0.3	0.2
50.....	5.0	3.0	2.3	1.6	1.0	0.7	0.5	0.3	0.3

Note: To estimate the standard errors for the period 1956-1966, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

Differences. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, this formula will overestimate the true standard error. These statements are true whether one deals with estimated numbers of persons or families, estimated proportions of classes of persons or families, or ratios of estimated numbers or proportions.

Illustration of the computation of the standard error of a difference in percentages. Table B shows that of the 832,000 females 25 to 34 years old attending college, 30.9 percent were attending full time. The apparent difference between males and females in full-time attendance is thus 10.1 percent. Table B-4 shows that the standard error of 30.9 percent on a base of 832,000 to be about 2.3 percent. The standard error of the corresponding 41.0 percent for males 25 to 34 is 2.0 percent as shown above. The standard error of the estimated difference in percentage is about $\sqrt{2.3^2 + 2.0^2} = 3.0$ percent. This means the chances are 68 out of 100 that the estimated difference based on the 1974 sample would differ from the difference derived using census figures by less than 3.0 percent. The 68 percent confidence interval about the 10.1 percent difference is from 7.1 to 13.1 percent, i.e., 10.1 ± 3.0 percent. The 95 percent confidence interval is 4.1 to 16.1 percent. Thus, we can conclude with 95 percent confidence that the percentage of female college students 25 to 34 attending full time actually differs from the percentage of male college students 25 to 34 attending full time.

Table B-8. Estimates of Population in Age, Sex, Race Groups: October 1974

(In thousands)

Age	Total		White		Negro and other races	
	Male	Female	Male	Female	Male	Female
3 years	1,763	1,686	1,469	1,397	295	290
